HOW YOUR BODY USES
MACRONUTRIENTS

Carbs. Fats. Proteins. Different nutrients, same goal — to give you energy, support your body, and keep you healthy.

1 Carbohydrates

Your body's quick fuel.

GLUCOSE
Carbs are broken down into glucose, your body's main source of energy.

QUICK ENERGY
Provides immediate energy for your brain, muscles and daily activities

STORED AS GLYCOGEN
Extra glucose is stored in your liver and muscles for later use.

2 Fats

Your long-term reserve.

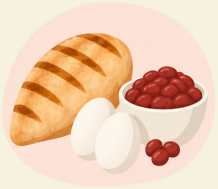

FATTY ACIDS & GLYCEROL
Broken down into fatty acids and glycerol for energy and cell structure.

LONGER-TERM ENERGY
Used when your body needs sustained fuel.

STORED IN ADIPOSE TISSUE
Excess fat is stored in fat cells.

3 Proteins

Builds, repairs, and regulates.

AMINO ACIDS
Broken down into amino acids, the building blocks of your body.

MUSCLE & TISSUE BUILDING
Helps repair and grow muscle, skin, hair and other tissues.

ENZYMES & HORMONES
Helps make enzymes, hormones and anti-bodies that keep your body working.

4 THE JOURNEY

From food to fuel.

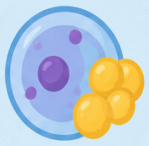

FOOD
You eat a mix of carbs, fats and proteins.

DIGESTION
Enzymes break food into smaller nutrients.

BLOODSTREAM
Nutrients are absorbed and transported to cells.

CELLS / STORAGE
Used for energy or stored for later use.

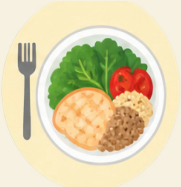

BUILDING & REPAIR
Supports muscle, organs and ongoing cell function.

5 THE TAKEAWAY

Balance fuels your best self.

Choose a variety
of nutrient-dense foods.

Stay hydrated
for efficient nutrient transport.

Aim for balance
Carbs, fats and proteins all matter.
